

ABSTRACT

The correlation value calculation section 201 for a data channel decides the symbol rate of data channel signals based on a plurality of correlation values after
5 having obtained a correlation value per symbol for each of the symbol rates that become candidates of specified symbol rates, with respect to the data channel signals of specified symbol rates, and the re-spreading section 208 carries out spreading processing with a spreading
10 code corresponding to the decided symbol rate, thereby generating replica signals.
